Using OpenGL

CSCI 4229/5229
Computer Graphics
Fall 2023

Types of Objects

- glBegin(type)
  - GL_POINTS points
  - GL_LINES lines between pairs of points
  - GL_LINE_STRIP   series of line segments
  - GL_LINE_LOOP   closed GL_LINE_STRIP
  - GL_POLYGON simple polygon
  - GL_TRIANGLES triangles between triples of points
  - GL_TRIANGLE_STRIP series of triangles
  - GL_TRIANGLE_FAN fan of triangles
- Set coordinates with glVertex
- glEnd()

Qualifiers

- glPointSize(float size)
  - POINT size in pixels (default 1)
- glLineWidth(float width)
  - LINE width in pixels (default 1)
- glLineStipple(int factor,unsigned short pattern)
  - LINE type
  - Requires glEnable(GL_LINE_STIPPLE)

Color

- Default is RGB color
  - X11 TrueColor
  - R,G,B 0-1 or integer range
    - glColor3f(1.0 , 0.0 .0.0)
    - glColor3b(127 , 0 , 0);
    - glColor3ub(255 , 0 , 0);
    - glColor3fv(rgbarray);
- Color can also contain transparency (alpha)
  - glColor4f(1.0 , 0.0 . 0.0 , 0.5);
  - Default alpha=1 (opaque)
- Stays in effect until you change color

Indexed Color

- X11 Direct Color

  – Based on a colormap

- Set color using   glIndexi(27)

- Need to load colors into color map using glutSetColor()

- Use RGB color unless hardware constraine

- Deprecated in OpenGL 3 since it really is obsolete

Displaying a scene

- Register using glutDisplayFunc()
- glClear()
- *Draw Something*
- glFlush()
- glutSwapBuffers()
- Schedule using glutPostRedisplay()

Transformations

- Transformation apply to everything that follows
- Transformations are cumulative
  - Call glLoadIdentity() in display()
- Primitive operations
  - glLoadIdentity();
  - glTranslate[fd](dx , dy , dz)
  - glScale[fd](Sx , Sy , Sz)
  - glRotate[fd](angle , Ux , Uy , Uz)
- Compatibility profile in OpenGL4 still useful

glTranslate[fd](dx , dy , dz);

- Move an object in three dimensions

- Allows you to easily produce multiple copies of an object

- Always takes 3D coordinates (float or double)

glScale[fd](Sx , Sy , Sz)

- Change the scale along the axes
- Multiplicative factors
  - |S|<1 shrink
  - |S|>1 expand
  - Negative values creates mirror image
- Allows you to easily create multiple copies of the same type at different sizes

glRotate[fd](angle , Ux , Uy , Uz)

- Rotates around the origin and axis (Ux,Uy,Uz)
- Angle is measured in degrees
- The axis often a primary axis, but may be any axis
    - Undefined behavior if Ux=Uy=Uz=0
- Allows you to create multiple copies of the same object viewed from different sides, or to view the scene from different positions

Temporary Transformations

- glPushMatrix()
  - Saves the current transformation
- glPopMatrix()
  - Resets the transformation to what it was when you did the push
- Allows you to build complex transformations and then get them back

Compound Transformations

- Rotate angle around the point (X,Y,Z) and axis (Ux,Uy,Uz)
    - glTranslated(-X,-Y,-Z)
    - glRotated(angle,Ux,Uy,Uz)
    - glTranslated(X,Y,Z)
- OpenGL does this intelligently

Projections

- Orthographic
  - glOrtho(left,right,bottom,top,near,far)
  - Same size regardless of distance
  - Easiest to use
- Perspective
  - glFrustrum(left,right,bottom,top,near,far)
  - Closer objects are bigger
  - GLU convenience functions
    - gluPerspective(fov,aspect,Znear,Zfar)
    - gluLookAt(Ex,Ey,Ez , Cx,Cy,Cz , Ux,Uy,Uz)

Text

- OpenGL provides only hooks for fonts
- Stroked fonts
  - Lines and fills write the characters
- Bitmap (raster) fonts
  - Characters are raster images
- Orientation, size, etc. treated just like any other drawing elements

Text using GLUT

- glutBitmapCharacter(GLUT_FONTTYPE,ch)
  - Single charcter
  - Limited font selection
- glRasterPos3d(x,y,z)
  - Sets position to write text in (x,y,z) coordinates
- glWindowPos2i(x,y)
  - Sets position to write text in pixels coordinates

Registering Callbacks

- Display
  - glutDisplayFunc()   Draw the scene
  - glutReshapeFunc()   Window resized
  - glutIdleFunc()   Nothing more scheduled
- User input
  - glutKeyboardFunc()   Key pressed
  - glutSpecialFunc()   Special key pressed
  - glutMouseFunc()   Mouse button
  - glutMotionFunc()   Mouse motion
- Many more

Keyboard Input

- special(int key,int x,int y)
  - Cursor keys GLUT_KEY_LEFT, GLUT_KEY_UP,…
  - Function keys GLUT_KEY_Fx
  - Basically anything not an ASCII key
- keyboard(char ch,int x,int y)
  - Regular ASCII keystrokes
- (x,y) is the mouse position in pixels

Setting Modes

- glutInitDisplayMode
  - Interfaces with the window manager to get the right kind of window (BE CAREFUL ABOUT DEFAULTS)
- glEnable() & glDisable()
  - Switches OpenGL into various modes
    - GL_DEPTH_TEST
    - GL_ALPHA_TEST
    - GL_CULL_FACE
    - GL_LIGHTING
  - Different modes for different objects

Checking for Errors

- OpenGL fails silently
- Functions do not return an error code
- glGetError() must be called explicitly to check for errors
- A black screen is a sure signal of an error
