

Textures for Data Storage: Shadows

CSCI 4830/7000

Advanced Computer Graphics

Spring 2009

Shadows in Computer Graphics

- Shadows are important to realism
 - Depth cues
 - Relative positions of objects
- Doesn't “just happen” when lighting is turned on
 - Nor is there a `glEnable(GL_SHADOWS)`
- Scene must be rendered 2-4 times
- Shader implementation can be efficient
 - Draw once every time the light or scene changes
 - Draw once for every eye position

Shader Examples

- Planar Shadows (ex31)
 - Shadows on the floor only
- Shadow Volumes (ex32)
 - True shadow, very hard
- Shadow Maps (ex33)
 - True shadows, depth in textures
- Shader Shadow Map (ex44)
 - Fast implementation via shader

Planar Shadows

- Projects object on surface
- Simplest shadows
- Fast but very limited
- The problem:

- Surface defined by point E and normal N
- L is the light
- P is on the object
- Find P' the projection of P on the surface

Extend $L\vec{P}$ to P'

$$P' = L + \lambda(P - L)$$

Let P' be in the plane

$$(P' - E) \cdot N = 0$$

Expand P' to

$$(L + \lambda(P - L) - E) \cdot N = 0$$

Then

$$\lambda = \frac{(E - L) \cdot N}{(P - L) \cdot N}$$

so that

$$P' = L + \frac{(E - L) \cdot N}{(P - L) \cdot N} (P - L)$$

Define

$$e = E \cdot N, \quad l = L \cdot N, \quad c = (E - L) \cdot N = e - l$$

Then

$$P' = L + \frac{c}{P \cdot N - l} (P - L)$$

Therefore

$$\begin{aligned}
 x' &= \frac{(N_x L_x + c)P_x + (N_y L_x)P_y + (N_z L_x)P_z - eL_x}{N_x P_x + N_y P_y + N_z P_z - l} \\
 y' &= \frac{(N_x L_y)P_x + (N_y L_y + c)P_y + (N_z L_y)P_z - eL_y}{N_x P_x + N_y P_y + N_z P_z - l} \\
 z' &= \frac{(N_x L_z)P_x + (N_y L_z)P_y + (N_z L_z + c)P_z - eL_z}{N_x P_x + N_y P_y + N_z P_z - l}
 \end{aligned}$$

so that

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} L_x N_x + c & L_x N_y & L_x N_z & -eL_x \\ L_y N_x & L_y N_y + c & L_y N_z & -eL_y \\ L_z N_x & L_z N_y & L_z N_z + c & -eL_z \\ N_x & N_y & N_z & -l \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Shadow Volumes

- The volume corresponding to the shadow cast by a facet of each object
 - Potentially multiple shadow volumes per object
 - Shadow of the object is the combination of all shadow volumes for the object

Shadow Volume Algorithm

- Count transitions in and out of shadow volumes
 - Increment of in, decrement for out
 - Similar to polygon winding rule for in/out
- Lit areas has value of zero (initial value)

Shadow Mapping

- Project with light as viewpoint
- Depth buffer from light
- Light/shadow determined just like visibility
 - Objects in light foremost in depth buffer
 - Objects in shadow depth obscured
- Requires second depth buffer
 - Store depth to texture
 - Compare R to texture
- In OpenGL extensions
- Used in *Toy Story* etc.

Shadow Map Example

No Shadows

Light View

Light View Depth

Shadow Map Shader

- Draw shadow map
 - Bind framebuffer to depth texture
 - Draw scene with eye at light to generate depths
 - Update if light or scene changes
- Draw scene
 - Generate texture coordinates with light PoV
 - Compare depth (R) with depth texture
 - $R = \text{depth}$ means lit –light as normal
 - $R > \text{depth}$ means shadowed –ambient light only
- Fast, Simple, Realistic
