

# **Drawing Lines & Anti-Aliasing**

**CSCI 4229/5229  
Computer Graphics  
Summer 2020**

# Scan Converting Lines

- Which pixels to turn on?
  - Floating point
  - Bresenham algorithm

# Floating Point Algorithm

- Functional form

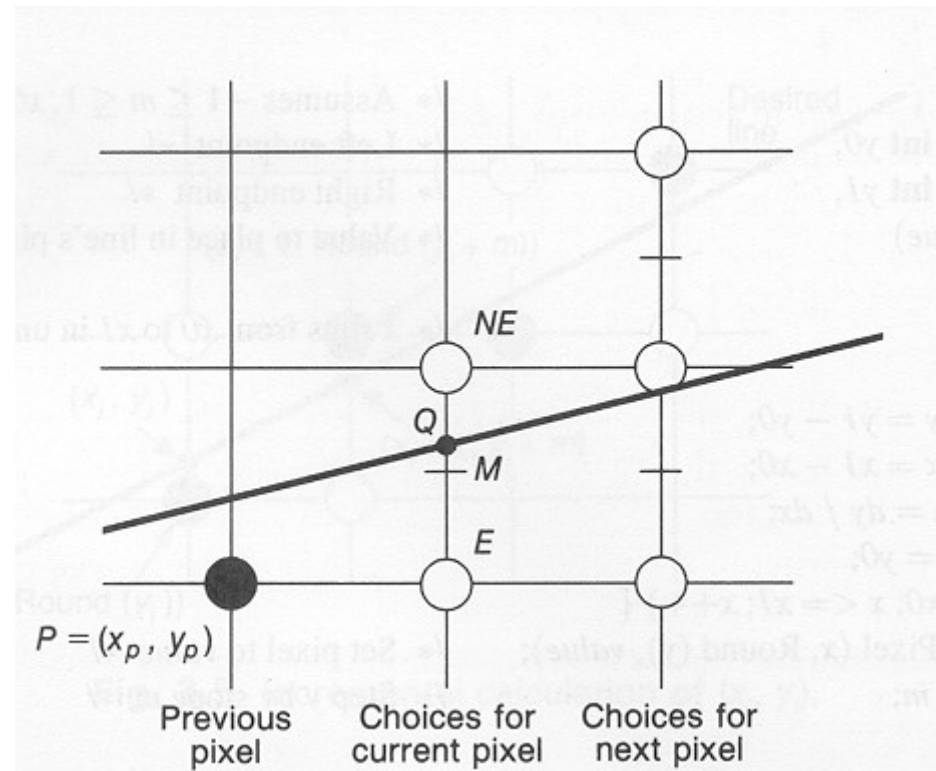

$$y = (x-x_0)(y_1-y_0)/(x_1-x_0)+y_0 \quad (\text{use when } |y_1-y_0| < |x_1-x_0|)$$

$$x = (y-y_0)(x_1-x_0)/(y_1-y_0)+x_0 \quad (\text{use when } |x_1-x_0| < |y_1-y_0|)$$

- Evaluate  $y$  or  $x$  at integral values of  $x$  or  $y$
- Round result to nearest integer to decide pixel
- Slow
  - integer  $\rightarrow$  float
  - float multiply and two float additions
  - float  $\rightarrow$  integer

# Bresenham Algorithm

- Select next pixel from two choices: E or NE
  - Only works when slope is  $\leq 1$
  - Is midpoint above or below the line?
- All integer operations
  - One or two adds

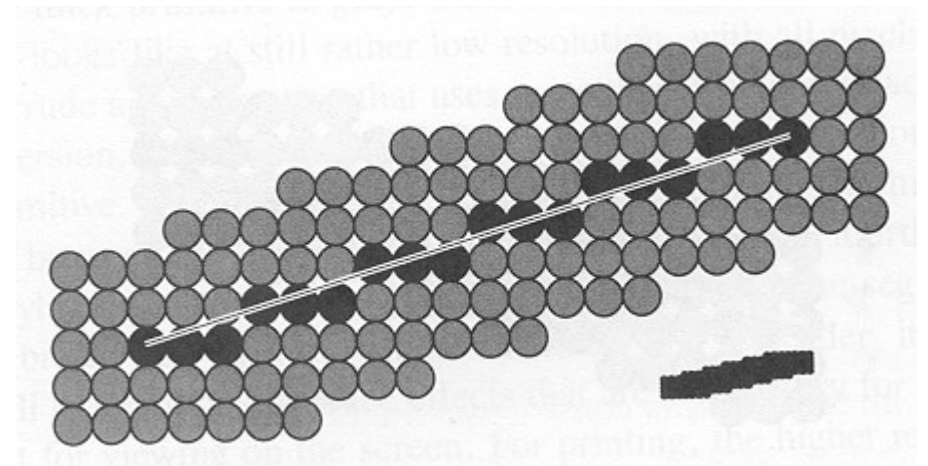

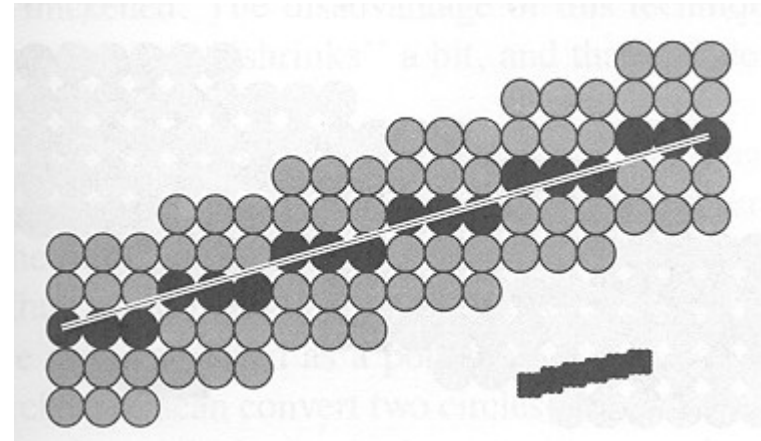

# Line intensity

- Lines parallel to axes appear more dense than lines at 45 degree angles by  $\sqrt{2}$
- If this is an issue you can adjust the pixel intensity inversely proportional to the cosine

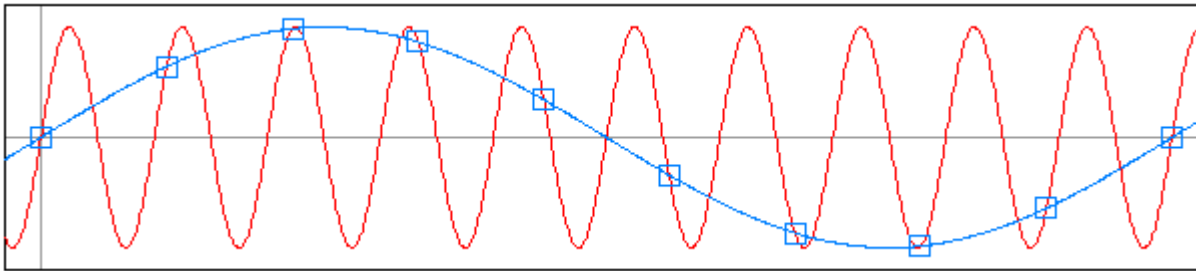

# Thick Lines

- Column replication
- Rectangular pen
- Polygon fill

# Anti-aliasing in signal processing

- Discrete samples of a signal

- Low and high frequency samples are the same

# Anti-aliasing in Computer Graphics

- Aliased lines

- Discrete pixels are turned on
- Nearest pixel selected
- Leads to “jaggies”

- Anti-aliased lines

- Pixels are partially turned on
- Level selected by line overlap
- Leads to smoother lines

# OpenGL Anti-aliased Lines

- `glEnable(GL_LINE_SMOOTH);`
- `glEnable(GL_BLEND);`
- `glBlendFunc (GL_SRC_ALPHA,  
                  GL_ONE_MINUS_SRC_ALPHA);`
- `glLineWidth(1.5);`
